University of North Carolina at Charlotte

Consulting Company

NPS is correlated with company revenue growth

Net Promoter Score (NPS) – today's standard for measuring customer loyalty

NPS rating for all clients

Customer Satisfaction Problem Solutions Overview Approach Conclusions

Customer Satisfaction Software Tools Recommender Systems Text Analytics and Sentiment Analysis Tools

Customer Satisfaction Software Tools

- Survey design
- Feedback collection
- Score trend analysis over time
- Limited analytics and insight

Temper: https://www.temper.io/

How It Works

Improve customer experience & satisfaction over time.

<u>Temper</u>

Collecting Customers Data Limited Analytics

Clarabridge CX Analytics [http://www.clarabridge.com/]

Key Features:

Deep Natural Language Processing (NLP) - Accurately analyze mountains of unstructured data to zero in on aspects of business that drive customers' dissatisfaction.

Linguistic categorization - Intelligently groups customer comments into topic buckets for smarter analysis.

Emotion detection - Decipher the emotional state of customers based on the tone of the feedback.

Context-sensitive sentiment analysis - Understands the intensity of feelings expressed by using deep Natural Language Processing, adjusting for industry and source-specific nuances.

Advanced discovery tools - Get to the core of customer issues using single click root cause analysis; unearth previously unknown topics using fully automated topic detection engine.

Speech analytics Capture customer's voice, literally, by analyzing call recordings in the same platform as all our other data sources.

- Does not discover actionable knowledge
- Data analytics does not provide any recommendations which guarantee NPS improvement

TATA Company: collects not only customers text data but also voice & video

Customer Satisfaction Problem Solutions Overview Approach Conclusions

Introduction Net Promoter Score Motivation

Structured and unstructured feedback

CLIRS <

- **Our System**
- Score ratings 0-10 scale, "star" ratings
- Unstructured: free-form text
 - thoughts
 - feelings
 - expectations

Decision Table built from customers survey

New attributes can be derived					Text can b	Mining & Ser be used to bu	itiment Mining ild new attributes	

Sentiment analysis

Different levels of sentiment analysis:

Document level

- general sentiment of all notes combined as a whole
- Sentence level
 - Distinguishes between *subjective* and *objective* sentences
- Entity and aspect level
 - What exactly people liked and did not like

Python NLTK Text Classification demo

- Demo uses classifiers trained on both twitter sentiment as well as movie reviews
- The results will be more accurate on text that is similar to original training data
- general sentiment analysis tools do not work very well

Laborator

Sentiment analysis tools

Conclusion: General sentiment analysis tools are not domain-specific

RapidMiner experiment

PLAN FOR TODAY'S PRESENTATION

CLIRS - Customer Loyalty Improvement Recommender System

Definitions/Concepts needed to understand how CLIRS is built & works:

- 1) Reducts in Decision Systems
- 2) Action Rules and Meta-Actions
- 3) Decision Tables & Their Semantic Similarity

ingo

Promoter

Decision Granules: {x1,x4,x6}, {x2,x4,x6}

Classification Granules: Bench1: {x1,x2,x6}, {x3,x4}, {x5,x7} Bench2: {x1},{x2},{x3,x4},{x5,x6,x7} Smallest Granules: {x1},{x2},{x3,x4},{x5,x7},{x6}

Informal Definition:

Reduct – smallest subset of classification attributes which **preserves** distribution of objects in Figure 1

Decision System & Reducts (Rough Sets)

<i>Reduct1</i> = {	[Muscle	-pain,T	[emp.]
--------------------	---------	---------	--------

	U	Muscle pain	Temp.	Flu
	U1,U4	Yes	Normal	No
	U2	Yes	High	Yes
	<i>U3,U6</i>	Yes	Very-high	Yes
	U 5	No	High	No

Reduct2 = {Headache, Temp.}

U	Headache	Temp.	Flu
U1	Yes	Norlmal	No
<i>U2</i>	Yes	High	Yes
<i>U3</i>	Yes	Very-high	Yes
U4	No	Normal	No
U 5	No	High	No
U6	No	Very-high	Yes

U	Headache	Muscle pain	Temp.	Flu
U1	Yes	Yes	Normal	No
U 2	Yes	Yes	High	Yes
U 3	Yes	Yes	Very-high	Yes
U4	No	Yes	Normal	No
U 5	No	No	High	No
U6	No	Yes	Very-high	Yes

We are looking for rules describing Flu in terms of Headache, Muscle Pain, Temp.

ACTION RULES & META ACTIONS

Action Rules Miner:

Action4ft-Miner module in LISP Miner <u>http://lispminer.vse.cz/procedures/index.php?system=Ac4ftMiner</u> [developed by Jan Rauch (Univ. of Economics, Prague, Czech Republic]

Meta Action Miners:Only Domain Specific(parts of domain specific software)

Triggers of Action Rules

Semantic Similarity

 $R_k = \{r_{k,i} : i \in I\}$ set of rules extracted from decision table D_k and $[c_{k,i}, s_{k,i}]$ denotes the confidence and support of rule r_i for all $i \in I_k$, k=1,2 With R_k , the number $K(R_k) = \Sigma \{ c_{k,i} \cdot s_{k,i} : i \in I_k \}$ is associated.

Assume that $R_k = \{r_{k,i}: i \in I\}$ is set of rules extracted from decision table D_k and $R_n = \{r_{n,j}: j \in J\}$ set of rules extracted from decision table D_n . Also, assume that $R = [R_k - R_n] \cup [R_n - R_k] \cup [R_n \cap R_k]$, $R1=[R_k - R_n] = \{r_{1, i1}: i1 \in I1\}, R2=[R_n - R_k] = \{r_{2, i2}: i2 \in I2\},$ $R3=[R_n \cap R_k] = \{r_{3, i3}: i3 \in I3\}.$

The semantic distance dist(D_k , D_n) between decision tables D_k and D_n , is defined as Σ { $c_{1,i1} \cdot s_{1,i1}$: $r_{1,i1} \in R1$ } + Σ { $c_{2,i2} \cdot s_{2,i2}$: $r_{2,i2} \in R2$ }+ Σ { $|c_{3,i1} - c_{3,i2}| \cdot |s_{3,i1} - s_{3,i2}|$: $r_{3,i3} \in R3$ }

Coming back to our customers feedback dataset

Rough Set REDUCTS have been used to identify features having the strongest impact on Promoter

Benchmark All Overall Satisfaction	35
Benchmark All Likelihood to be Repeat Customer	34
Benchmark All Dealer Communication	33
Benchmark Service Repair Completed Correctly	32
Benchmark Referral Behavior	31
Benchmark Service Final Invoice Matched Expectations	31
Benchmark Ease of Contact	30
Benchmark All Does Customer have Future Needs	28
Benchmark Service Tech Promised in Expected Timeframe	26
Benchmark Service Repair Completed When Promised	26
Benchmark Service Timeliness of Invoice	25
Benchmark Service Appointment Availability	24
Benchmark Service Tech Equipped to do Job	23
Benchmark All Contact Status of Future Needs	22
Benchmark Service Tech Arrived When Promised	21
Benchmark All Has Issue Been Resolved	19
Benchmark All Contact Status of Issue	17
Benchmark Service Technician Communication	6
Benchmark Service Contact Preference	3
Benchmark CB Call answered promptly	1
Benchmark Service Received Quote for Repair	1
Benchmark CB Auto attendant answered by correct department	1
Benchmark Service Call Answered Quickly	1
Renchmark All Marketing Permission	1
Denominary An Marketing Fermission	1

Randomly chosen customers are asked to complete Questionnaire. It has questions concerning personal data + 30 benchmarks

To compute NPS we calculate average score of selected benchmarks for all customers. Knowing the number of promoters and detractors we know NPS. Customer Satisfaction Problem Solutions Overview Approach Conclusions

Introduction Net Promoter Score Motivation

Motivation

- Insight into the entire anatomy of feedback
- Discover hidden trends and patterns

survey type, and the impact on NPS

Visualization for yearly trends in customers' sentiment analysis towards different aspects - benchmarks, for chosen client and

RECOMMENDER SYSTEM CLIRS

based on semantic extension of a client dataset created by adding datasets of other semantically similar clients

Classical Approach

Knowledge Extraction (Classical Tools - WEKA + Our Software for Extracting Action Rules & Their Triggers)

Classification Selection of Best Classification Algorithm

	PART	RBF	BayesNet	NaiveBayes	KNN	RandomForest	J48 ★
Accuracy	2	3	4	1	5	7	6
Time Taken	2	4	6	7	3	1	5
Total score	4	7	10	8	8	8	11

Two Options

Using Information about 34 Clients to Enlarge these Datasets

2 global approach

More Powerful Recommender Systems

FIRST APPROACH for Dataset Enlargement

Semantic Distance between Clients

More similar these two classification trees, more close semantically the clients are

Cluster Dendrogram

Semantic distance based dendrogram for Service

dist.mat hclust (*, "complete")

Recommender System Engine based on Semantic Similarity of Clients

Now, from the enlarged Decision Table, we extract action rules

Examples of action rules:

((Benchmark: All Overall Satisfaction, (1->10))* (Benchmark: All Dealer Communication, (1->5))) =>(Detractor->Promoter) sup= 5.0, conf= 100.0

((Benchmark: Service-Repair Completed When Promised, (8->3))* (Benchmark: All Dealer Communication, (1->10))) =>(Detractor->Promoter) sup= 5.0, conf= 100.0

NPS

Experiments with Semantic Dendrogram

• Performance of HAMIS on 34 clients with semantic similarity based dendrogram.

Comparison of sets of action rules extracted from dataset of Client 2 **before/after** HAMIS.

Expansion with Geographical Dist.

- Motivation:
 - Limitations of applying HAMIS with semantic similarity based dendrogram.
 - Merging with the most semantically similar clients may not be the only choice.

Take weighted combination of semantic & geographic distance

Now, when the dataset (decision system) is built, we will start extracting action rules

Action rule

Shows actions to undertake

IF Benchmark1 (3->6) AND Benchmark2 (7->9) THEN Detractor -> Promoter

To make change happen

"Traditional" rules: IF Benchmark1 =3 AND Benchmark2 =7 THEN Detractor

IF Benchmark1 =6 AND Benchmark2 =9 THEN Promoter

Show simply associations

Changes do not happen

On their own...

Meta actions:

External, "higher-level" events that trigger changes in Benchmarks

Meta

action1action2IF Benchmark1 (3->6) AND Benchmark2 (7->9)THEN Detractor -> Promoter

Meta action3

Meta

Where to get

Meta actions from...

Meta actions are mined from text:

Customer	Status	م_1	Q_2	Qn	Comments
Customer1	Detractor	3	7		He stated that he feels the prices are high. He also stated that getting them on the phone is not easy. He stated that when he calls, he needs parts right away and sometimes he gets transferred to different locations and Amarillo is closest to him.
Customer2	<u>Promoter</u>	6	9		She stated she never has problems and the parts are good quality. She stated she receives good customer service and good communication as they are prompt sending back emails.

Mining detractor's sentiment:

Ease

"He stated that he feels the prices are high. He also stated that getting them on the phone is not easy. He stated that when he calls, he needs par's right away and sometimes he gets transferred to different locations and Amarillo is closest to him."

Price

competitiveness

Mining promoter's sentiment:

Staff attitude

1. Action rules:

- Are mined from large datasets with data mining algorithms
- Can be understood as patterns in the dataset
- Each rule is characterized by:
 - Support how many customers can be changed
 - Confidence probability of changing a customer

IF Benchmark1 (3->6) AND Benchmark2 (7->9) THEN Detractor -> Promoter, sup=10, conf=90%

> 10 customers can be changed in this way with the probability of 90%

2. Meta action mining:

Customer	Status	0,1	9,2	Q_n	Comments
Customer1	Detractor	3	7		He stated that he feels the prices are high. He also stated that getting them on the phone is not easy. He stated that when he calls, he needs parts right away and sometimes he gets transferred to different locations and Amarillo is closest to him.
Customer2	Promoter	6	9		"She stated she never has problems and the parts are good quality. She stated she receives good customer service and good communication as they are prompt sending back emails."

Order

Ease

 "He stated that he feels the prices are high. He also stated that getting them on the phone is not easy. He stated that when he calls, he needs parts right away and sometimes he gets transferred to different locations and Amarillo is closest to him. "

Parts quality

"She stated she never has problems and the parts are good quality. She stated she receives good customer service and good communication as they are prompt sending back emotes."

Service quality

Staff

attitude

Communication quality

Communication
